

CSE 321 Course Project

Overview

You are required to design, implement, demo and present a Realtime embedded system product. You will decide on an idea and get the approval of the instructor or the TA. You may work in a team of two or by yourself. The goal of this assignment is to develop an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics.

Approach: What to do? How do it?

You will develop the project in three phases, each phase with its own deliverables. The project should include elements (hardware and software) of Realtime and embedded systems we are learning in this course. We will grade deliverable of all three phases.

Phase 1 (9/30/2025: hard deadline)

The Idea:

You will research the application domains of Realtime embedded systems and explore the socio-cultural scene and human landscape around you, industry trends, and discover the needs. Understand the challenges in these domains you are exploring and help address these. A fine example is from [1,2]. These are high-level and technical description of an insulin pump. Read these and understand an impactful RTEM that is helping millions of people. The insulin pump is an extensive system as you see from the diagram given in reference [2]. Of course, your idea is a much simpler system that can be completed within a semester. We will be using Arduino platform (more details to come during lecture as well as in the recitation.) See [5] for some sample projects.

Formulate the problem and design the solution

Formulating the problem (description) that you are planning to solve begins with identifying the users, use cases and how they will interact and benefit from your product. Draw the UML use case diagram [3] representing your project product. You can use draw.io (<https://www.draw.io/>) or lucid chart or tools such as these for drawing the diagrams. From the use case diagram discover the components and use the CRC model (classes, responsibilities, collaboration)

[4] to discover the modules of your product. Obtain at least one card representing your project. There may be more, one for the original problem, one for the hardware module and one for the software module. Capture design details in block diagrams and flow charts to describe a possible solution. By this stage, you should have a clear idea of the components you need for engineering your product and what you want to do with them. Order the components or discuss it with your instructor about the availability of the components from the cse321 lab. For example, we can lend you Arduino, and a few related sensors. Make a detailed list of components, sensors, actuators and tools their purpose and where to procure them. Discuss with the TA and place the order for and/or collect all the necessary components and tools.

Outcomes of phase 1

On completion of this phase, you will be able to analyze a problem and design and represent a solution and procure the components for implementing the solution.

Deliverables of phase 1 (Due date: 9/30/2025)

1. Problem title and statement - clear and detailed – minimum 100 words (20%)
2. UML use case diagram explaining the problem (15%)
3. CRC cards explaining the modules of the solution and their responsibilities (15%)
4. Flow chart and architectural block diagram (25%)
5. Components list with details of the status (on hand, got it from an instructor–name, ordered) (20%)
6. All these items (1-5) recorded in a single document with a suitable name box identifying you and the project, and the PrjPhase1V1.pdf submitted on Brightspace. (5%)

Phase 2: Due date: 11/11/2025)

The Prototype

Phase 2 of the term project involves implementing the idea and the design you developed in Phase 1.

Implement the solution

Use the Prj1Phase1.pdf design document as a guideline and implement the modules identified in the CRC card and detailed in the other UML diagrams.

- Construct the hardware components and test them.

- Choose a suitable programming language.
- Program and simulate the software components and debug them.
- Put the components together and test the integrated components.
- Meet with the TA during recitation to get help and to keep them updated on your progress.
- More important is to document the prototyping and testing details for later submission.

Don't forget to record any issues you faced and how you addressed them. This phase may include photos of prototype(s), test scripts and test patterns.

Outcomes of phase 2

On completion of this phase, you will be able to develop and implement a prototype based on a design document.

Deliverables (Due date: 11/11/2025)

A working prototype of the software and hardware components and the integrated system. A short demo to one of the TA about the status of the prototype is required. Here are the deliverables of this phase.

1. Hardware component prototype (~30%)
2. Software component - codebase (~30%)
3. The test scripts and patterns (data) (20%)
4. Photos of the prototype (10%)
5. Observations and notes (10%)
6. All these items (1-5) recorded in a single document with a suitable name box identifying you and the project, and the PrjPhase2V1.pdf submitted on Brightspace. (5%)

Phase 3 (Due date: 12/2/2025)

The final product

This phase is about putting it all together. Compare the design in Phase 1 and its implementation in Phase 2. It may be necessary to go back to phase 1 and adjust the design details in case any changes were needed in the original design; let the updated document be PrjPhase1V2.pdf . Same with the phase resulting in an updated document PrjPhase2V2.pdf. Fine-tune the prototype to meet the non-functional requirements. Maybe to debug some parts that are not working as expected. Make changes to the phase 2 prototype to finalize the product. Give it a marketable name.

Document

- Create a video of the working of the final project.
- Add a readme file that tells a user how to deploy, use, and interact with the product.
- Create a 6-slide (min) presentation
- Capture a video of the project (20%)
- TermProject.zip file (40%)
- Present your project to TA, or instructor (40%)

Deliverables (Due date: 12/2/2025)

- Create a folder with the structure and gather all the items shown in Figure 1 for the three phases.
- Submit a compressed zip file.

Outcomes of term project

On completion of the term project, you will be able to provide a problem formulation (analysis and design) and a solution for it by applying principles of engineering, science, and mathematics principles.

Project rules and requirements

1. This project cannot be a repeat and reuse of a project from another class.
2. It should have Realtime and embedded system components (specify the percentages for each: RT (%), EM (%))
3. Make sure you pay attention to the due dates and plan accordingly.
